10-8 VIDEO

DIGITAL EVIDENCE SOLUTIONS

Thank you for your interest in our 10-8 Patrol Car Video system. Built from the ground up, our system is designed for reliability and automation – day in and day out. It turns on automatically when the emergency equipment is activated, and it can be powered up manually any time an officer wants to record without the emergency lights. The system is programmed for both Pre & Post event recording; meaning that every time the system is activated, it captures approximately 30 seconds of video prior to the activation, and continues recording a few seconds after it's de-activated, so you never miss important evidence that may be lost otherwise.

Reliability is key! Even our first unit in the original test patrol car is still recording today, just as it has since its installation in April of 2008, and it has never missed a beat! Above all else, this is what has our clients talking. They wanted a simple, cost-effective, easy to use, system that works without fail. And that's exactly what we delivered. In fact, we are so confident about our reliability that we include a 3-year, no questions asked, replacement on any failed component. Once installed, any of the 4 components can be swapped out in 5 minutes or less.

The system comes standard with a GPS receiver and a G-force [crash] sensor. Users find the GPS particularly useful as it displays location coordinates and vehicle speed directly on the video. During playback on a PC, vehicle position is overlaid on Google Maps® for a turn-by-turn record of each incident.

The recorder uses a standard SDHC card that stores an average of 10 to 14 days of vehicle stops and calls. Cards are easily removed for transfer to a computer, and the software provides options for archiving all events or single events for court.

We offer both 1- and 2-camera systems. The optional second camera includes a day/night infrared camera for viewing prisoners transported in the back seat and has a built-in microphone that captures audio from the interior of the vehicle.

MONITOR

This 4" color touch screen monitor is built into the rear view mirror and easily turns off at night.

CAMERA

Our system camera of choice is a Sony CCD chipset with 520TVL resolution and Wide Dynamic Range for excellent quality at night. And it rotates 360 degrees for recording in any direction.

WIRELESS MIC SYSTEMS (NOT PICTURED)

Our UHF body-worn, external microphone transmitters have 300' range and can transmit over different 99 channels. It uses rechargeable AA batteries.

The optional 2.4ghz microphone transmitter boasts a range of 1,200', can transmit over 200 channels, and can activate the recorder remotely. It includes a recharging cradle.

ALL DIGITAL DVR

Our integrated digital DVR has no moving parts and provides secured access to 2 SDHC cards for up to 64gb total storage. It has built in GPS and crash sensors, and is activated two ways: 1. automatically, whenever the emergency equipment is turned on, or 2. manually, by the officer.
